                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ဌ
                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PT Quantitating messenger RNA in sample - using immobilised-poly-ps Claim 14 and 38; Page 47; 177pp; English.

CC the sequences given in Q47445-51 are probes which were used in the CC quantification of human GTP binding protein (G protein) specific CC mRNAs. These probes are derived from human and rat G-protein CC sequences. These probes were used in the method of the invention, CC for the detection and quantification of mRNAs in a sample without CC immobilising an oligomer complementary to this sequence to an CC insoluble support. The sample is then incubated with the insoluble coligomer and be immobilised. Non-immobilised components are washed CC from the support and bound RNA is labelled in such a way that the CC label is incorporated onto the support relative to the amount of CC mRNA on the support. The amount of bound label is then determined. CC mRNA on the support. The amount of bound label is then determined. CC diagnosing and recognition of pathophysiology of various disease states, eg. hereditary diseases, cancer, and infectious diseases. CC groteins are thought to be involved in causing various diseases convolved in invasive and metastatic melanoma cells, and diabetes. Seminor CC Seminor CC observation and metastatic melanoma cells, and diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New SSX gene family members - useful for assaying for cancer cells Claim 15; Page 8; 19pp; English.

This is the nucleotide sequence of primer SSX 1B(3'), which corresponds to nucleotides 440-465 of the human SSX1 gene. It is used with primer SSX 1A(5') (see V70064) in PCR amplifications in order to determine expression of the SSX1 gene in normal and tumour tissues. Gene-specific primer pairs (see V70064-73) are provided for SSX genes 1-5. Determination of SSX gene expression provides a means for assaying for cancers such as melanoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ន្តន្តន្តន្ត
                                                                                                                                                                   PT Quantification gessenger RNA in sample - using immobilised poly-
PS Claim 14 and 38; Page 47, 177pp; English.

CC The sequences given in Q47445-51 are probes which were used in the
CC quantification of human GTP binding protein (G protein) specific
CC mRNAs. These probes are derived from human and rat G-protein
CC sequences. These probes were used in the method of the invention,
CC for the detection and quantification of mRNAs in a sample without
CC the need to purify the mRNA from cells. The claimed method comprises
CC identifying a polynuclectide sequence unique to the mRNA, and
CC inmobilising an oilgomer complementary to this sequence to an
CC ingomer and be immobilised. Non-immobilised components are washed
CC oligomer and be immobilised. Non-immobilised components are washed
CC from the support and bound RNA is labelled in such a way that the
CC label is incorporated onto the support relative to the amount of
CC diagnosing and recognition of pathophysiology of various disease.
CC quantification of multiple varieties of mRNA. It may be used for
CC diagnosing and recognition of pathophysiology of various disease.
CC states. A genetic deficiency of Gs protein is the molecular basis of
CC hereditary osteodystrophy. Pliuitary tumours in acromegalic patients
CC have been shown to contain mutant Gs proteins. G proteins are also
CC clovolved in invasive and metastatic melanomer cells, and diabetes.

PT Amplification and detection of target nucleic acid sequences - PT comprises chemical linkage of oligo:nucleotide probe complement PT pairs, esp. useful for detecting single point mutation(s) pairs, esp. useful for detecting single point mutation(s) PS Example 1; Page 62; 128pp; English.

CC The sequences given in T43146-49 represent probes which were used in the Aman CC papilloma virus (HPV) type 16 genome using the method of the invention.

CC The method uses two oligonucleotide probe complement pairs (OPCPs). Each CC member of the probe pair contains a chemical functionality group which come another following hybridisation of the probe pairs to the tengent of the probe in each OPCP is composed of two regions; the first region hybridises to the target and contains the chemical functionality group while the second region prevents target independent joining. The CC other probe in the OPCP contains the corresponding chemical functionality group while the second region prevents target independent joining. The CC other probe pairs in a OPCP are joined, they can serve as template CC for the second OPCP, which can in turn serve as template for unjoined CC first probe pairs in a cyclic amplification process. The method provides of sequences. It can identify minute sequence alterations in genes such as point mutations. The method can be used for the diagnosts of specific CC disease or testing of susceptibility to diseases such as autoimune to classification and sectorm. paternity testing, forensic conserve the content of the presence of t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ₽
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PT DNA encoding variable region of antibody HNK-20 - for treating PT respiratory syncytial virus infection

Example; Page 39; 75pp; English.

CC T30459-T30545 represent amplification primers for the coding sequences CC for the variable chains of an antibody produced by the hybridoma cell Cline HNK-20. T30464-T30498 represent amplification primers for the coding sequence for the variable kappa chain of the HNK-20 antibody. CC HNK-20 is a murine hybridoma cell line, that produces IgA specific for CC the F glycoprotein of respiratory syncytial virus (RSV). The variable specific for the 5' untranslated region of the variable region, and for CC the intron downstream of the rearranged J region. The amplified CC sequences can be inserted into vectors containing heterologous (such as CC human) constant region genes, for the production of chimeric and cC can didagnosis of infection by RSV, such as pneumonia and bronchiolitis, CC and diagnosis of infection by RSV, such as a template, variable region genes can be isolated without producing fragments that have to be a contained for recombinant antibody expression. Also, by using the genomic CC base, no knowledge of the DNA sequence encoding the target variable region can recombine contained contained from the encoded morefules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

CC The sequences given in T4316-49 represent probes which were used in the CC amplification and detection of a 54 by sequence contained in the Human CC papilloma virus (HPV) type 16 genome using the method of the invention. CC The method uses two ollgonucleotide probe complement pairs (OPCPs). Each CC permits linkage of the probes when the functionality groups are adjacent to one another following hybridisation of the probe pairs to the cemplate. One probe in each OPCP is composed of two regions; the first cregion hybridises to the target and contains the chemical functionality group while the second region prevents target independent joining. The CC group while the second region prevents target independent joining. The CC group while the second opcp, which can in turn serve as template for unjoined CC group. When two probes in a OPCP are joined, they can serve as template for the non-enzymatic amplification process. The method provides for the non-enzymatic amplification process. The method provides CC first probe pairs in a cyclic amplification process. The method provides GC for the non-enzymatic amplification and detection of target nucleic acid sequences. It can identify minute sequence alterations in genes such as conditional process if cation-HAr-typing, sex determin, paternity testing, forensic CC diseases or cancers. It can also be used for the diagnosis of specific CC diseases or cancers. It can also be used for identifying the presence of trail sequences in plant or animal samples.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DR WPI; 98-28697/25.

DR WPI; 98-28697/25.

PT bal bacterial promoter for increasing expression of heterologous prolypeptide - containing components of tac and gal promoters, especially for producing enzymes for oligosaccharide synthesis propertially for producing enzymes for oligosaccharide synthesis process for oligosaccharide synthesis promoter from the UDPgalactose of the containing the tac promoter from the UDPgalactose-4-epimerase constitutes for the promoter was designed to hybridise to contain the promoter was designed to hybridise to contain the promoter on pHP1/tac, while the 3 for promoter was designed to hybridise to a sequenced region of the galf promoter was designed to hybridise to a sequenced region of the galf constitutes which encompassed both the tac and galf promoters (see CC v31431), was inserted into pPHOX2. The invention provides novel coperably linked to a heterologous nucleic acid which encodes a compassed both the cacid which encodes a cacid which encodes a cacid which encodes a cacid which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

This fusion protein can be used in cca method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be sequence 33 BP; 11 A; 7 C; 9 G; 6 T.

The novel derivative contains the sequence encoding the extracellular domain 4 of TNF-alpha deleted and replaced by a synthetic oligonucleotide (V05902). The amplified sequence is cloned into a vector for expression in E. coli. Sequence 33 BP; 12 A; 8 C; 7 G; 6 T;
                                                                                                                                                                                                                                                                                                                                     19-MAY 1998 (first entry)
19-MAY 1998 (first entry)
Primer Bio52 for green fluorescent protein coding sequence.
Green fluorescent protein; GFP; blue fluorescent protein; BFP;
genetic engineering marker; gene therapy; PCR primer; amplify;
                                                                                                                                                                                                                                         Aequorea victoria.

transformation, subcellular localisation of proteins, for assessing proteins formation, subcellular localisation of proteins, for assessing protein that the protein (GFP) of Aequorea victoria. The amplified sequence is mutated to produce the nucleic acid of the invention that encodes a composed that is (a) a protein that has Leu at position 65 (and optionally further Cys at 66) and has cellular composed to the sequence at least 5 times that of wild-type GFP or (b) is a blue of Leu at 65 and Ala at 164, and has cellular fluorescence at least 5 (composed that of BFP (Tyr67 to His). The nucleic acids can be used as composed that of BFP (Tyr67 to His). The nucleic acids can be used to detect and characterise regulatory and coding sequence elements that composed to subcellular expression and targeting of proteins. Typical control subcellular expression and targeting of proteins. Typical control of a promoter induced by a particular analyte); assessment of compounds; and for drug screening (where expression is controlled by the promoter of a target gene), particularly for antiviral cor antiparasitic agents.

Sequence 34 BP; 12 A; 8 C; 9 G; 5 T;

                                                                                                                         Claim 13; Page 10; 31pp; English.

Primer L126N is one of several primers which are preferred for in amplifying inter-repeat regions of DNA. The amplified fra are subjected to 2-D electrophoresis on the basis of length differences in base sequence. The resulting separation patter transferred to a filter for screening with a probe. The method be used to detect genetic variation.

See Q27389-Q27404 and Q33141-Q33144.

PO MCCIcle acid probes for detection of shigella and other pathogens per used to diagnose dysentery in non-isotopic test format and have utility in non-isotopic test formats requiring amplification for per high sensitivity

PS Claim 35: Page 99; L39pp; English.

CC The sequences given in 037534-45 are probes which was derived from Shigella specific fragment NT11-2. These probes substantially retain CC the exclusivity behaviour of NT11-2 towards non-enteroinvasive E. coli (EIEC) Enterobacteriaceae. Probes such as this one can be used in the detaction of dysentry causing microbes. See also 037506-35.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polynucleotide amplification using bivalent PCR primer to generate rolling circle intermediate or linear concatemers - requires reduce amt. of primer compared to conventional PCR example 2; Fig SA; 77pp; English.

The present sequence is a component oligonucleotide of the 2.71 kb plasmid pl85fil (Stemmer (1994) Nature 370:389), which encodes the gene and promoter region for R-TEM1 beta-lactamase. A collection of 134 component oligonucleotides, including the present sequence, were synthesised and used to assemble the plasmid by end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Plasmid p1825fil component oligonucleotide R18.

green fluorescent protein

Example 6; Page 121; 209pp; English.

Mutagenic PCR primers T73029-43 were used to amplify the TEM-1
betalactamase gene, and introduce mutations into it. The present prim
introduces the amino acid change Glul04Lys. The TEM-1 betalactamase g
confers resistance to bacteria against approximately 0.02 micrograms
the drug cefotaxime. TEM-1 betalactamase is a very efficient enzyme.
                                                                                                                                                                                                                                                                                                                                               12-FEB-1998 (first entry)
Mutagenic PCR primer 7 for the TEM-1 betalactamase gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC limited in its reaction rate by diffusion. The mutated TEM-1
CC obetalactamase genes were used in a novel method to construct mutant
CC combinations of the gene, which produce enzymes with a greater activity.
CC The method involves recombining at least 2 forms of the polynucleotide to
CC produce a library of recombinant forms of the sequence. The library is
CC screened for a recombinant sequence, which is then recombined with
CC another form of the polynucleotide, the same or different from the first
CC another form of the polynucleotide, the same or different from the first
CC polynucleotides. The subsequent libraries are screened, and recombination
CC performed until the recombinant polynucleotide has acquired the desired
CC property. The methods are used to reassemble DNA after random
CC in vivo recombination. The repeated cycles of mutagenesis, shuffling and
CC in vivo recombination. The repeated cycles of mutagenesis, shuffling and
CC of proteins. In particular the methods are used for the production of
CC mutant CFP protein which has been modified to show enhanced fluorescence
CC when used as a reporter of gene expression and regulation. Also
CC cadmium detoxification bacteria, drug resistance genes and variant
CC consumerases.

cross-linked enzyme donor polypeptide - which has reduced complementation activity with enzyme acceptor polypeptide and may be used in assays for e.g. viral protease

Example 5; Page 20; 36pp; English.
This sequence represents an amplification primer for a beta-galactosidase alpha region (ED7) linked to a 8 residue (p17/p24) HIV protease recognition site. The amplified sequence encodes a polypeptide of the invention. The polypeptide of the invention is a cross-linked enzyme donor polypeptide having an amino acid sequence substantially identical to the N-terminal or C-terminal of native beta-galactosidase is. The . . . amino acid sequence has 2 cysteine residues intramolecularly linked via a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (RIBO-) RIBOZYME PHARM INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ribozymes targeted to interleukin 2 - useful for treating e.g. cancer, autoimmune disease and allergies Claim 11; Page 39; 61pp; English. The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (IL)-2R gamma encoded RNA. V93889 to V94574 represent specifically claimed ribozymes, and V94575 to V95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor. sequence 54 BP; 17 A; 11 C; 11 G; 15 U;

The enzyme donor polypeptides may be used in assays, e.g. for viral proteases (see w09727320). Such assays can be carried out with extremely low inherent background signal. PT plasmid pAP-1 and expression vectors for transforming bacterial pT cell - contains recombinant DNA for encoding coupled Escherichia pT cell - contains recombinant DNA for encoding coupled Escherichia pT coll surface antibody and PAL pS Example 1; Fig lb; 6pp; German.

CC The PAL gene from E.coli was amplified in plasmid pRC2 using the CC polymerase chain reaction. The upstream primer introduces a BanHI CC site at the 5'end of the gene resulting in the substitution of CYs at position 1 of PAL by Gly. The amplified PAL sequence was ligated CC to DNA fragments coding for the variable regions of heavy and light CC chains of a humanised chicken lysozyme antibody joined via a DNA CC fragment encoding an 18-amino acid sequence representing the epitope CC YOL/34 (the "TAG-linker"). Immediately upstream of the VH gene were CC ligated a promoter/operator region, RBS and pelB leader sequence. The CC resulting plasmid was designated pAP-1 and can be used for the rapid cC screening of antibody gene banks, e.g. to isolate antibody against thumour-associated antigen. This oligonucleotide probe is complementary to a region in the 2.7 kilobase D1721 locus, a highly repetitive sequence. The use of probes complementary to a highly repeated sequence or to a conserved sequence provides high detection sensitivity and specificity. The probe may be optionally labelled with biotin and used in methods to quantitate the amount of DNA in a sample. See Q62532-51.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  19-CAN-1993 (first entry)

R Nucleic acids that are HIV-1 nucleocapsid ligands of HIV-1 infection

T Nucleic acids that are HIV-1 nucleocapsid ligands - fc

T Nucleic acids that are HIV-1 nucleocapsid of diagnosis or HIV-1; 17pe 11gands of TP9101-T79122 are RNA ligands for the nucleocapsid of immunodeficiency virus type 1 (HIV-1). The ligands bin nucleocapsid and inhibit its function, they can be use treatment and diagnosis of HIV-1 infection.

CA single-stranded DNA (or its complementary strand or the corresp. CC double-stranded DNA) which comprises one of the 7837 "GS" sequences cc given in T19001-T26837 and which is able to hybridise to part of CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) cs sequences were obtained from 3'-directed cDNA libraries prepared cC from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-c untranslated sequence is unique to a particular mRNA species, almost call the 3'-oriented cDNAs hybridise with specific mRNAs. Each library call the 3'-oriented so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be cerognising different cell types.

So sequences as means of diagnosing abnormal cell function or for recognising different cell types.

Claim 1: Page 111: 137pp; English.

The sequences given in Q5129-54 represent the 5' and 3' splice regions of the introns from the Fanconi Anemia Group C Complementing (FACC) DNA. Three cDNA molecules which are cellular varients of a single cDNA, are transcribed from the FACC gene. The three cDNAs each contain an identical open reading frame encoding the FACC protein may be used for the diagnosis and study of fanconi anemia. The FACC gene and cDNAs may be used in gene therapy. This oligonuclectide probe is complementary to a region in the 2.7 kilobase D1721 locus, a highly repetitive sequence. The use of probes complementary to a highly repeated sequence or to a conserved sequence provides high detection sensitivity and specificity. The probe may be optionally labelled with biotin and used in methods to quantitate the amount of DNA in a sample. See Q62532-51.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              oligo:nucleotide probes for detecting human DNA - having sequences complementary to a human alpha satellite locus or a conserved sequence in the mitochondrial genome Claim 6; Page 15; 27pp; English.

This oligonucleotide probe is complementary to a region in the 2.7 kilobase DI721 locus, a highly repetitive sequence. The use of probes complementary to a highly repeated sequence or to a conserved sequence provides high detection sensitivity and specificity. The probe may be optionally labelled with biotin and used in methods to quantitate the amount of DNA in a sample. See Q62532-51. Sequence 130 BP; 32 A; 26 C; 28 G; 44 T;

PI Adams MD, Moreno RF, Venter CJ;

PI Rathers for human genes transcribed in-vivo, facilitate tagging pr markers for human genes transcribed in-vivo, facilitate tagging pr of most human genes transcribed in-vivo, facilitate tagging pr of most human genes transcribed in-vivo, the can be used as markers CC library as part of a large set of ESTs which can be used as markers CC for human genes transcribed in vivo. They can be used to facilitate CC tagging of most human genes, for mapping locations of expressed genes con chromosomes, for individual or forensic identification, for mapping CC locations of disease-associated genes, for dentification of tissue CC type, and for prepn. of antisense sequences, probes and constructs. CC EST01247 has a "poor" coding probability as evaluated using the CC coding-region prediction program CRM. See also Q59041-Q61440.

Claim 16; Page 18; 25pp; English.
This sequence represents that of the insert of plasmid pBS609-51
created by the ligation of the PCR product prepared using primer
WBS2 (Q30017) into pBS. PCR primer Q30017 is used to amplify a
region of the 171 bp alpha satellite (alphoid) repeat sequence,
conserved in all human chromosomes. This binds to the alpha
satellite repeat concensus sequence. The minimal product size
expected is 175bp, and is used as a probe for the repeat sequenc
of human centromeres.

This sequence represents that of the insert of plasmid pBS609-52 created by the ligation of the PCR product prepared using primer WBS4 (Q30018) into pBS. PCR primer Q30018 is used to amplify a region of the 171 bp alpha satellite (alphoid) repeat sequence, conserved in all human chromosomes. This binds to the alpha satellite repeat concensus sequence. The minimal product size expected is 175bp, and is used as a probe for the repeat sequence of human centromeres.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA (or its complementary strand or the corresp. Could ouble-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA ilbraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-cuntranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

Claim 8: Page 31: 70pp: English.

T79775 represents intron 6 of the potato starch-branching enzyme
(SBE) gene. Sequences antisense to introns of the SBE gene are used to produce transgenic plants producing modified or new forms of starch for industrial use. The sequences allow starches to be made without post-harvest modification (which uses hazardous chemicals and requires much energy). Using the antisense intron sequences is more reliable, efficient and selective than known methods for regulating enzymatic activity because there is almost no homology between introns in different SBE genes. The SBE gene promoter (see T79783) is also
                                                                                                                                                                                                                                                                                                                                                                                                                                   (MATS/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gene signature; messenger RNA; mRNA; relative abundance; human; cloning; mapping; non-biased library; diagnosis; decell typing; abnormal cell function; ss.
                                                                                                                                                                                                                                                                                                                                       Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                             Matsubara K, Okubo K;

Claim 6; Page 10; 41pp; Japanese.

Claim 6; Page 10; 41pp; Japanese.

The nucleotide sequence of the retrotransposon probe Tos12 cloned from the rice plant Oryza sativa. The probes may be used for the analysis plant genes to secure the efficient identification of plants and genet uniformity for the production of pure lines, inbred parent lines and near-isogenic lines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pr New polynucleotides encoding human secreted proteins - derived from Pr e.g. human blood, kidney, foetal lung, placenta, testes, brain, pr e.g. human blood, kidney, foetal lung, placenta, testes, brain, pr ovary, pituitary, retina and colon cDNA libraries
Pr ovary, pituitary, resquence isolated from a variety of human tissue color are all secreted EST sequences isolated from a variety of human tissue cources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and color treating, preventing or ameliorating defical conditions in humans and color animals, although no supporting data is given. Suggested activities
Province activity, chemotactic/chemokinetic activity, haemostatic activity, catherin/tumour invasion suppressor activity, tumour inhibition activity, receptor/ligand activity, tumour inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

PE Example 2; Page 18; 47pp; English.

CC The present sequence represents a model pre-therapeutic RNA molecule comprising a binding region for target pre-mRNA, at least one of 3' and CC 5' splice sites, sequences functional as RNA or sequences encoding a CC therapeutic or useful protein or gene product (e.g. subunit A of CC elements required for splicing and production of a therapeutic RNA. CC elements required for splicing and production of a therapeutic RNA. CC elements required for splicing and production of a therapeutic RNA. CC elements required for splicing and production of a therapeutic RNA. CC elements required for splicing and production of a therapeutic RNA. CC elements required for splicing and the HSV protein marker allows for detection using monoclonal antibodies. Pre-therapeutic molecules are CC detection using monoclonal antibodies. Pre-therapeutic molecules are used to produce functional therapeutic RNA or nucleic acid analogues in Specific target cells, which may be present in animals, plants, and CC especially humans. The pre-therapeutic molecule does not have to be targeted to a particular type of cell, as the the therapeutic molecule CC targeted to a particular type of cell, as the the therapeutic molecule CC targeted with virus (e.g. human immunodeficiency virus) or other CC pathogens, benign and malignant neoplastic cells (e.g. prostatic constance of the immune system involved in autoimmune constance of the product generates and tissue rejection. Otherwise the product generates and tissue rejection. There are now gene product of the promable expressed

Preventing or reducing severity of diabetes - by inhibiting the preventing or reducing severity. By interfering with activity of specific T-cells, partic. by interfering with processor activity of specific T-cell receptors

PI diabetes-associated T cell receptors

CC DNA sequences (096132-34) coding for non-conserved regions of T-cell cell receptor (TCR) beta-14 (R78688-88) may be operatively linked to expression CC control sequences and incorporated into vectors. These vectors are directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of a diabetic care directly injected into e.g. the skeletal muscle of T cell care directly injected into e.g. t

Exon 5 (T01037) of the mouse T-cell costimulatory molecule B7-2
gene encodes the cytoplasmic domain (R82890) of B7-2. It can
be used to construct nucleic acids coding for novel cytoplasmic
forms of T-cell costimulatory molecules that also incorporate a
second cytoplasmic domain. Such T-cell costimulatory molecules bind
to CD28 or CTLA4 and trigger a costimulatory signal in T-cells.

PT New DNA sequences isolated from endogenous human retroviral element
PT and related vectors, transformed cells, proteins and antibodies,
PT useful for diagnosis, treatment and prevention of breast cancer
PS Claim 11; Page 65; 173pp; English.
CC wiseful for diagnosis, treatment and prevention or measurement of
CC useful in detecting human breast cancer. Detection or measurement of
CC useful in vaccines for inhibiting development (for grevention or
CC useful in vaccines for inhibiting development (for prevention or
CC therapy) of breast cancer. The polypeptides may also be used to
CC raise monoclonal antibodies, used as immunoassay reagents.
SQ Sequence 293 BP; 66 A; 43 C; 48 G; 73 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁

Evaluation of proliferative state of cells transformed with human papilloma virus - by determining cyclin-dependent kinase activity induced by E7 onco-protein Disclosure; Columns 19-20; 14pp; English.

The present sequence encodes Human papillomavirus (HPV), strain 16, E7 oncoprotein. The proliferative state of a cell transformed with HPV can be evaluated in the following manner. Cyclin-dependent kinase complexes containing protein P21CIPI (W46887-88) are isolated from the transformed cell, and the HPV E7 oncoprotein added to the isolated protein. Cyclin-cyclin-dependent kinase complexes are isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             E7 oncoprotein; proliferative state; HPV; kinase active cyclin/cyclin-dependent kinase; p2lCIP1; interaction; cyclin/cyclin-dependent kinase inhibitor; ss.

The kinase action of the 2 samples are measured, where a proliferating transformed cell has a greater kinase activity that the untransformed cell. The meth used for determining the extent of interaction and/or inactivation between a cyclin/cyclin-dependent kinase inhibitor and the HPV E7 oncoprotein and thus evaluating the proliferative state of a transf
                                                                                                                                                                                                                                                                                                                    Q76420

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of most human genes

Example 4; page 374; 500pp; English.

Example 4; page 374; 500pp; English.

The Expressed Sequence Tag was isolated from a human brain cDNA
library as part of a large set of ESTs which can be used as markers
for human genes transcribed in vivo. They can be used to facilitate
tagging of most human genes, for mapping locations of expressed genes
on chromosomes, for individual or forensic identification, for mapping
locations of disease-associated genes, for identification of tissue
type, and for prepn. of antisense sequences, probes and constructs.
EST90813 has a "poor" coding probability as evaluated using the
coding-region prediction program CRM. See also Q59041-Q61440.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Provery, pituitary, retina and colon cDNA libraries

Claim 1, Page 167-168; 641pp; English.

CC The present sequence represents an expressed sequence tag (EST), and is

CC a polynucleotide of the invention. The polynucleotides of the invention

CC are all secreted EST sequences isolated from a variety of human tissue

CC sources. The EST sequences and proteins encoded by them are predicted to

CC have useful biological activities which would make them suitable for

CC treating, preventing or ameliorating medical conditions in humans and

CC animals, although no supporting data is given. Suggested activity,

CC haematopolesis regulating activity, tissue growth activity, haemostatic

CC activin/Inhibin activity, chemotactic/chemokinetic activity, haemostatic

CC and thrombolytic activity, chemotactio/themokinetic activity, anti-inflammatory

CC activity. The EST sequences are also stated to be useful for gene
                                                                             Claim 1; Page 985-986; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp. Codouble-stranded DNA) which comprises one of the 7837 "GS" sequences given in 719001-726837 and which is able to hybridise to part of thuman genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-cuntranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  markers for human genes transcribed in-vivo, facilitate tagging of most human genes
Example 1; Page 122; 500pp; English.
The Expressed Sequence Tag was isolated from a human brain cDNA
The Expressed Sequence Tag was isolated from a human brain cDNA
The Expressed Sequence Tag was isolated from a human brain cDNA
The Expressed Sequence Tag was isolated from a human brain cDNA
The Expressed Sequence Tag was isolated from the used as markers
for human genes transcribed in vivo. They can be used to facilitate
tagging of most human genes, for mapping locations of expressed genes
on chromosomes, for individual or forensic identification, for mapping
locations of disease-associated genes, for identification of tissue
type, and for prepn. of antisense sequences, probes and constructs.
EST00070 has a "poor" coding probability as evaluated using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      12-FEB-1992; US-837195.

CITH'S sequence is part of the human chromosome 21 centromere, and can be cused in the DNA construct of the invention. The construct is a mammalian cartificial chromosome (MAC), and comprises a mammalian telomere and a centromere, where the centromere has a DNA sequence containing copies of the CENP-B box sequence. The invention also relates to methods for cetablishing yeast artificial chromosomes (YACs) comprising mammalian ctelomeres and centromeres. The method can be used to construct, modify and stably maintain YACs in yeast cells which have the ability to form CC dateonomously, be stably maintain cells. The MACs can replicate cautonomously, be stably maintained extrachromosomes and transmitted confictently in mammalian cells. The MACs can be used for basic studies on coganisation and function of mammalian chromosomes and also as a vector to introduce DNA segments (genes) of interest to test their functions in the subject to variable expression due to integration position effect nor cause unpredictable insertion mutation on host chromosomes. Furthermore CC MACs will have the capacity to accommodate a DNA segment up to megabases where an entire large gene or group of genes and regulatory elements could be included. The MACs can be used for somatic gene therapy or to

Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

Disclosure; Page 57; 95pp; English.

Disclosure; Page 57; 95pp; English.

CC used in the DNA construct of the human chromosome 21 centromere, and can be CC used in the DNA construct of the invention. The construct is a mammalian cC artificial chromosome (MAC), and comprises a mammalian telomere and a CC entromere, where the centromere has a DNA sequence containing copies of the CENP-B box sequence. The invention also relates to methods for CC establishing yeast artificial chromosomes (YACs) comprising mammalian CC enteromeres. The method can be used to construct, modify CC and stably maintain YACs in yeast cells which have the ability to form CC MACs when introduced into mammalian cells. The MACs can be used for basic studies on CC enteromously, be stably maintained extrachromosomally and transmitted CC efficiently in mammalian cells. The MACs can be used for basic studies on CC conganisation and function of mammalian chromosomes and also as a vector CC construct to variable expression due to interest to test their functions in CC cause unpredictable insertion mutation on host chromosomes. Furthermore CC MACs will have the capacity to accommodate a DNA segment up to megabases CC where an entire large gene or group of genes and regulatory elements CC could be included. The MACs can be used for somatic gene therapy or to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        용
                                                                                                                           PT Modifying potatoes to form amylopectin starch - using an anti-sense construct to inhibit granule-bound starch synthase PS Claim 1; Page 21; 46pp; English.

CC A genomic library in EMBL3 was prepared using leaves of the potato Bintje. The library was screened with CDNA clones for the 5' and 3'.

CC ends of the GBSS gene. A full-length clone of potato GBSS gene was cidentified (wx311). An EcoRI fragment ("w")of the clones was found to contain the start of the gene and was cloned in pUCl3 to give pSw.

CC cloned in pUCl3 to give 19NH35. Further restriction of 19NH35 with SC cloned in pUCl3 to give 19NH35. Further restriction of 19NH35 with SC translation start and the first 125bp of the coding region. The C translation start and the first 125bp of the coding region. The C fragment can be used to make antisense constructs to suppress amylose formation in potatoes. See also Q26401-4.

Claim 1; Page 529; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp. Codouble-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of the following period of the following construction of the GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-directed cDNA was initiated from the construction of mRNA by using poly(T) as the sole primer. Since the 3'-directed cDNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs, each library can be constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for ceograpising different cell types.

Q60547;
New DNA sequences isolated from endogenous human retroviral element - and related vectors, transformed cells, proteins and antibodies, useful for diagnosis, treatment and prevention of breast cancer claim 11; Page 65; 173pp; English.

V68999 to V69038 represent nucleotide sequences which encode polypeptides used in detecting human breast cancer. Detection or measurement of human breast tumour specific polypeptides and nucleotide sequences, or the corresponding RNA in a sample, is used for diagnosis and monitoring of breast cancer. Human breast tumour specific polypeptides and nucleotide sequences, and the vectors containing the DNAs, are also useful in vaccines for inhibiting development (for prevention or therapy) of breast cancer. The polypeptides may also be used to raise monoclonal antibodies, used as immunoassay reagents.

Example 4: Page 351: 500pp; English.

The Expressed Sequence Tag was isolated from a human brain cDNA
The Expressed Sequence Tag was isolated from a human brain cDNA
The Expressed Sequence Tag was isolated from a human brain cDNA
The Expressed Sequence Tag was isolated from a human brain cDNA
The Expressed Sequence Tag was isolated from a human brain cDNA
The Expressed Sequence Tag was isolated genes of care to facilitate
tagging of most human genes, for mapping locations of expressed genes
on chromosomes, for individual or forensic identification of tissue
locations of disease-associated genes, for identification of tissue
type, and for prepn. of antisense sequences, probes and constructs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA molecule encoding a polypeptide for detecting breast cancer #8 Human; breast cancer; breast tumour tissue; diagnosis; treatment; vaccine; epitope; endogenous; retroviral element; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity haematopolesis regulating activity, tissue growth activity, activiny. The estivity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, tumour inhibitio activity. Cadherin/tumour invasion suppressor activity, tumour inhibitio activity. The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EST clone GZ78.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                              PT New nucleic acid encoding human chemotactic cytokine III - used for PT treatment of e.g. tumours, infections, autoimmune diseases etc. PS Claim 4; Pages 58-59; 73pp; English.

CC This DNA encodes the human chemotactic cytokine III (CCIII). The CCIII CC attracts and activates macrophages (or their precursors), neutrophils, CC basophils and some lymphocytes. This DNA is used to produce recombinant CCIII (including in vivo production) for treatment of CC conditions associated with CCIII like tumours, chronic or parasitic infections, leukaemia, T-cell mediated autoimmune disease, psoriasis, CC asthmal are growth factor activity, inhibit angiogenesis or promote wound the ling. Antagonists of CCIII are used to regulate haematopoiesis, CC for example, in glomerulonephritis, infections, autoimmune disease, CC HTLV-1 related disease, arthritis, infections, autoimmune disease, CC diseases, or susceptibility to them, can also be diagnosed by detecting mutations in the gene encoding CCIII, or by detecting abnormal levels of CCIII, e.g. using CCIII specific antibodies in usual immunoassays. The antibodies can also be used to identify or detect CCIII expressing clones and to purify CCIII. This encoding DNA is also useful for chromosome CC identification and for cloning the genomic sequence.

The Expressed Sequence Tag was isolated from a human brain cDNA
library as part of a large set of ESTs which can be used as markers
for human genes transcribed in vivo. They can be used to facilitate
tagging of most human genes, for mapping locations of expressed genes
on chromosomes, for individual or forensic identification, for mapping
locations of disease-associated genes, for identification of tissue
type, and for prepn. of antisense sequences, probes and constructs.
